

Defining the Mer1 and Nam8 meiotic splicing regulons by cDNA rescue

Zhicheng R. Qiu, Beate Schwer, and Stewart Shuman

Supplemental Figure S1. ***SAE3* cDNA cannot rescue the *tgs1*Δ sporulation defect.** Wild-type and *tgs1*Δ diploids with or without *SAE3* cDNAs integrated at the chromosomal *LEU2* locus were examined by light microscopy at the indicated times after transfer to sporulation medium. The percentages of the cell population comprising 4-spore asci are plotted as a function of time. Each datum is the average of three independent experiments $\pm$ SEM.
