

Supplemental Figure S4. Editing occurs in stable introns lacking sufficient coverage to define EERs. (A) A long intron in *srh-171* never exhibits coverage depth greater than 2 reads. (B) Zooming in on several *srh-171* intronic reads (black outline in (A)) shows several A-to-G mismatches present (yellow G's in otherwise blue reads). Similar trends are seen for long introns in (C-D) *cept-2*, and (E-F) *T24E12.10*. Note in F that because *T24E12.10* is on the minus strand, editing-dependent mismatches appear as T-to-C changes.
